Seal supply systems

Brochure 84 Pages (Code: DMS_SSE)

The entire product portfolio of systems and components for the cooling, flushing, pressurization and supplying of liquid and gas-lubricated mechanical seals, e.g. quench and Thermosiphon systems, heat exchangers, buffer pressure systems, leakage monitoring and API682-compliant supply systems.

Important note

All the technical specifications are based on extensive tests and our many years of experience. However, the diversity of possible applications means that they can serve as guide values only.

It should be noted that the extremal values of each operating parameter cannot be applied at the same time because of their interaction. Furthermore, the operating range of each specific product depends on the respective shaft diameter, materials used, mode of operation and on the medium to be sealed.

A guarantee can only be given in the individual case if the exact conditions of application are known and these are confirmed in a special agreement. When critical conditions of operation are involved, we recommend consulting with our specialist engineers.

Subject to change.

Mechanical seal technology and selection

Brochure 58 pages (Code: DMS_TSE)

Technical principles, designation codes, API plans, notes on installation and operation and articles covering theory and practice are summarized in the first part. The second part concerns choosing a seal according to media. Recommendations for arrangement, operation, type and materials of the required mechanical seal for over 900 media. With extensive additional information.

Carbon floating ring seals

Brochure 32 Pages (Code: EBES)

Maintenance-free, compact cartridge labyrinth seals with long service life and best performance from EagleBurgmann-Espey. For the sealing of gases, dust and vapors in turbines, fans, compressors, centrifuges and mills.

Cartex Dual seals

Features

- Dual seal
- Cartridge
- Balanced
- Independent of direction of rotation
- Double pressure balanced
- Integrated pumping device
- Variants available: for eccentric screw pumps (-Vario) and gas-lubricated version (-GSDN)

Advantages

- Ideal seal for standardizations
- Universal applicable for packings conversions, retrofits or OEM
- No dimensional modification of the seal chamber (centrifugal pumps) necessary, small radial installation height
- No damage of the shaft by dynamically loaded O-Ring
- Extended service life
- Installation faults are avoided, cost-effective
- No damage caused by dirt entered during assembly
- Straightforward and easy installation due to pre-assembled unit (reduced down-times)
- Individual adaptation to pump design possible
- Customer specific versions available

Operating range (see note on page 1)

Shaft diameter:
 $d_1 = 25 \dots 100 \text{ mm}$ (1.000" ... 4.000")
 Other sizes on request
 Temperature: $t = -40 \text{ }^\circ\text{C} \dots +220 \text{ }^\circ\text{C}$
 ($-40 \text{ }^\circ\text{F} \dots +428 \text{ }^\circ\text{F}$)
 (Check O-Ring resistance)

Sliding face material combination BQ1
 Pressure: $p_1 = 25 \text{ bar}$ (363 PSI)
 Sliding velocity: $v_g = 16 \text{ m/s}$ (52 ft/s)

Sliding face material combination Q1Q1 or U2Q1
 Pressure: $p_1 = 20 \text{ bar}$ (290 PSI)
 Sliding velocity: $v_g = 10 \text{ m/s}$ (33 ft/s)

Barrier fluid circulation system:
 $p_{3\text{max}} = 25 \text{ bar}$ (363 PSI)
 $\Delta p (p_3 - p_1)_{\text{ideal}} = 2 \dots 3 \text{ bar}$ (29 ... 44 PSI),
 7 bar (102 PSI) for barrier media with poor lubricating properties

Pump startup:
 $\Delta p (p_3 - p_1)_{\text{max}} = 25 \text{ bar}$ (363 PSI) allowed

Recommended supply medium: max. ISO VG 5
 Axial movement: $\pm 1.0 \text{ mm}$, $d_1 = 75 \text{ mm} \pm 1.5 \text{ mm}$

EA560

Features

- Single seal
- Loosely inserted seal face provides self-adjusting capability
- In-house manufactured sliding parts

Advantages

The EA560 is self-adjusting to shaft misalignments and deflections because of the loosely inserted seal face as well as the ability of the bellows to stretch and tighten. The length of the contact area of the bellows with the shaft is an optimum compromise between ease of assembly (less friction) and sufficient adhesive force for torque transmission. Additionally the seal fulfills very specific leakage requirements. Because the sliding parts are made in-house, a wide variety of special needs can be accommodated.

Operating range (see note on page 1)

EA100

Features

- Single seal
- In-house manufactured carbon seal faces
- Three different impeller connection available

Advantages

The EA100 is the specialist for low duty applications and one of our historic and bestselling seals in this sector. The seal is easy to handle and quick to install. An incorporated garter spring assures a good grip of the bellows on the shaft and enhances satisfactory sealing performance. With the ability of the bellows to stretch and tighten, the EA100 is insensitive to shaft movements.

The seal design is available in 3 types, each with a different impeller connection: EA102 is with a collar. EA103 is without a collar. EA104 provides a different coil spring installation. More information on EA103 and EA104 is available on request.

BT-AR

Mechanical seal for large-series cold water pumps, produced in millions of units per year. The BT-AR owes its success to the wide range of application, the short axial length (this allows for more economic pump construction and saves material), and the best quality/price ratio. The elasticity of the bellows design enables a more robust operation.

The BT-AR can also be used as a multiple seal in tandem or back-to-back arrangement when the product media cannot ensure lubrication, or when sealing media with a higher solids content. Installation proposals can be provided upon request.

Features

- Rubber bellows mechanical seal
- Unbalanced
- Single spring
- Independent of direction of rotation
- Short axial installation length

BT-PN

The BT-PN is a large series mechanical seal with a simple yet effective design that is easy to assemble. The special spring arrangement allows a short axial installation length. This advantage is combined with an increased working pressure capability of up to 12 bar (174 PSI). The spring is free from torque transmission.

Features

- Rubber bellows mechanical seals
- Unbalanced
- Single spring
- Independent of direction of rotation

Operating range (see note on page 1)

Shaft diameter: $d_1^* = 8 \dots 40 \text{ mm}$ (0.31" ... 1.57")
 Pressure: $p_1^{**} = 12 \text{ bar}$ (174 PSI),
 vacuum ... 0.5 bar (7.45 PSI)
 Temperature: $t^{**} = -20 \text{ °C} \dots +120 \text{ °C}$ (-4 °F ... +248 °F)
 Sliding velocity: $v_g = 10 \text{ m/s}$ (33 ft/s)

Operating limits depend on p-v_g factor

Splitex

Features

- Fully split single seal, 2 x 2 segments, pre-assembled
- Semi-cartridge
- Balanced
- Stationary springs
- Bi-directional
- External pressurization
- Built-in flushing connections
- Installation and wear control

Advantages

- Reduced repair and downtime: 2 x 2 pre-assembled design speeds up and simplifies installation because pump does not have to be disassembled.
- Long service life: precise pre-alignment because of pre-assembled segments. Stationary springs which are protected from the product prevent clogging.
- Greater flexibility during installation: no modification necessary because the seal is located outside of the stuffing box.
- Shaft protection: uniform torque transmission via clamping ring prevents damage caused by set screws.
- Dependable operation: mechanical decoupling of clamping ring (torque transmission) avoids distortion of the seat.
- Simple monitoring of the seal during operation because of mechanical wear indicator on the seal face.
- Low leakage: elimination of secondary seals eliminates leakage paths between split components.
- High tolerance to shaft deflections ensured by stationary design and elastic seat mounting (gasket).

HRGS-DC

Gas-buffered double seal. The HRGS-DC is designed for applications involving fitting dimensions in line with DIN 24960 C or ANSI Big Bore standard, but can also be used even when the fitting dimensions are not of standardized nature if large, open spaces are available for installation. The CGSH is used as outboard seal up to nominal width 125.

HRGS-DD

Acc. to API 682 configuration 3NC-FB, Plan 74. The HRGS-DD corresponds to the HRGS-DC in terms of design principal and materials. It is designed for applications involving large shaft diameters of up to 200 mm (7.87") or fairly high pressure levels of up to 40 bar (580 PSI). The outboard seal used in such cases is the DGS.

SeccoMix1-11

The SeccoMix1-11 is equipped in addition with a sleeve for trapping any abraded particles from the seal face. Contamination of the medium in the container is thus ruled out. The sleeve can be cleaned through a flushing bore. Please note: diameters (d_2 to d_5) increase to the next possible design size.

SeccoMix 481

Single seal. Dimensions see page 107

SeccoMix 481L

Single seal with integrated floating bearing.

SeccoMix 451

All types of the SeccoMix 481 range available for unstepped shafts (all diameters). Seal identification: SeccoMix 451 ... Customized design or e.g. different drives (torque transmissions) are available.

SeccoMix 461/(491)

For glass-lined vessels. Dimensions see page 109

SeccoMix 481-D

Double seal

SeccoMix 481L-D

Double seal with integrated floating bearing

These seals are designed to be self-closing on the product side, i.e. they will remain closed even with pressure variations or a pressure reversal. Operation is optionally the same as for the single version. In view of the mechanical seal on the atmosphere side it can be used as a buffer pressurized double seal. The barrier pressure should be 0.5 ... 1.0 bar (7.25 ... 15 PSI) above pressure to be sealed.

M481

Features

- For top entry drives, type M481 to DIN
- Single or double seals
- Unbalanced
- Independent of direction of rotation
- Multiple springs rotating
- Liquid-lubricated
- Cartridge unit

Advantages

- Ready-to-fit and factory-tested units
- Available with or without floating bearing
- Suitable for standardizations
- FDA certification
- Double seals can be applied at higher pressure and rotating speed than specified by DIN
- Due to the hydraulic conditions, product pressure as well overlaying barrier pressure closes the seal.

M481KL-D

Double seal with integrated floating bearing.

These seals are designed to be self-closing on the product side, i.e. they will remain closed even with pressure variations or a pressure reversal. Operation is optionally the same as for the single version ($p_{\max} = 6 \text{ bar (87 PSI)}$) or $\Delta p_{\max} = 6 \text{ bar (87 PSI)}$ at $p_1 > p_3$). In view of the mechanical seal on the atmosphere side it can be used as a buffer pressurized double seal $p_1 = 16 \text{ bar (232 PSI)}$.

DGS

Seals from the DGS series are the standard for medium pressures up to 120 bar (1,740 PSI). They have proven their suitability in thousands of applications worldwide. They are very rugged with a mature design concept. The advantage over the competition is hidden in the detail. For example, the torque is transmitted to the rotating seat by friction forces only. And thus no holes and resulting weakening of the material are needed.

Features

- Gas-lubricated
- Uni-directional or bi-directional
- Ready-to-fit cartridge unit
- Single, double, tandem and tandem with intermediate labyrinth available
- Separation seals as labyrinths, radial clearance seals or CobraSeal are optionally available

Advantages

- Wear-free and contact-free operation
- Self-cleaning 3D gas grooves
- High gas film stiffness
- Secure cupped retainer for seat
- Available in various materials for optimized chemical resistance
- Proven, reliable and economical solution

Operating range (see note on page 1)

DGS Single seal

Application: where leakage of the product into the atmosphere is not harmful, e.g. from air or nitrogen compressors or the axial cavity does not allow a tandem seal (e.g. geared compressors). This version allows process gas leakage to the corresponding flare / vent connection. Primary seal leakage is dissipated with the separation gas to the vent. The gas to be sealed must also be filtered and routed to the seal chamber via connection "A". The resulting flow from the sealed space to the impeller side prevents contaminated / wet gas reaching the Dry Gas Seal on the process gas side, e.g. towards the labyrinth.

Product variants

DGS Tandem seal

Application: where no N_2 is available and minimal process gas leakage to the atmosphere is acceptable, e.g. gas pipeline compressors. The seal on the bearing side is intended as a safety seal. The tandem arrangement offers particularly good operational safety. The process side and bearing side seals are able to withstand the full pressure. In normal operation, only the process side seal reduces the full pressure. The space between the process side and bearing side seals is routed to the flare via connection "B". The pressure to be sealed on the bearing side corresponds to the flare pressure. There is thus very little leakage to the bearing side or to the vent. If the primary seal fails, the secondary seal is activated as a back-up and operates at primary seal conditions.

- A Primary seal gas supply
- B Primary vent
- S Secondary vent
- D Separation gas supply

DGS Tandem seal with intermediate labyrinth

Application: where product leakage to the atmosphere is unacceptable, e.g. H_2 , ethylene or propylene compressors. With this type of seal, the product pressure to be sealed is reduced via the seal on the process side. The entire process gas leakage is routed to the flare via connection "B". The bearing side seal is pressurized with secondary seal gas (nitrogen) via connection "C". The pressure of the secondary seal gas ensures the flow through the labyrinth to the flare/tapping point.

- A Primary seal gas supply
- B Primary vent
- C Secondary gas seal supply
- S Secondary vent
- D Separation gas supply

DGS Double seal

Application: where product leakage to the atmosphere/flare is unacceptable or for low pressure applications. Seal gas leakage into the product needs to be permitted (seal gas pressure $p_3 > p_1$). This is used when a neutral seal gas is available at the appropriate pressure. Typical applications can be found in the chemical and petrochemical industries, e.g. in HC gas compressors. A seal gas, e.g. nitrogen at a pressure higher than the product pressure, is supplied between the seals via connection "C". Part of the seal gas leakage dissipates to the bearing side, while the other part goes to the product.

- A Buffer gas supply
- C Seal gas supply
- S Vent
- D Separation gas supply

PDGS

A well-established compressor seal for high pressure and both low and high temperature applications. Innovative design features allow it to cope with even the highest pressures without problems. Main components of the dynamic secondary seal of the PDGS are made of the extremely rigid material tungsten carbide which allows an optimum control of the extrusion clearance over the full range of operation. The specific design of the polymer cup seals ensures minimum sliding forces combined with wear-free operation.

PDGS Single seal

Application: where leakage of the product into the atmosphere is not harmful, e.g. from air or nitrogen compressors or the axial cavity does not allow a tandem seal (e.g. geared compressors). This version allows process gas leakage to the corresponding flare / vent connection. Primary seal leakage is dissipated with the separation gas to the vent. The gas to be sealed must also be filtered and routed to the seal chamber via connection "A". The resulting flow from the sealed space to the impeller side prevents contaminated / wet gas reaching the Dry Gas Seal on the process gas side, e.g. towards the labyrinth.

PDGS Tandem seal

Application: where no N_2 is available and minimal process gas leakage to the atmosphere is acceptable, e.g. gas pipeline compressors. The seal on the bearing side is intended as a safety seal. The tandem arrangement offers particularly good operational safety. The process side and bearing side seals are able to withstand the full pressure. In normal operation, only the process side seal reduces the full pressure. The space between the process side and bearing side seals is routed to the flare via connection "B". The pressure to be sealed on the bearing side corresponds to the flare pressure. There is thus very little leakage to the bearing side or to the vent. If the primary seal fails, the secondary seal is activated as a back-up and operates at primary seal conditions.

- S Secondary vent
- D Separation gas supply

PDGS Tandem seal with intermediate labyrinth

Application: where product leakage to the atmosphere is unacceptable, e.g. H_2 , ethylene or propylene compressors. With this type of seal, the product pressure to be sealed is reduced via the seal on the process side. The entire process gas leakage is routed to the flare via connection "B". The bearing side seal is pressurized with secondary seal gas (nitrogen) via connection "C". The pressure of the secondary seal gas ensures the flow through the labyrinth to the flare/tapping point.

- B Primary vent
- C Secondary gas seal supply
- S Secondary vent
- D Separation gas supply

PDGS Double seal

Application: where product leakage to the atmosphere/flare is unacceptable or for low pressure applications. Seal gas leakage into the product needs to be permitted (seal gas pressure $p_3 > p_1$). This is used when a neutral seal gas is available at the appropriate pressure. Typical applications can be found in the chemical and petrochemical industries, e.g. in HC gas compressors. A seal gas, e.g. nitrogen at a pressure higher than the product pressure, is supplied between the seals via connection "C". Part of the seal gas leakage dissipates to the bearing side, while the other part goes to the product.

MDGS

EagleBurgmann MDGS are rugged seals for screw compressors. They have a rotating ring made from ductile material with a high-performance coating. Rotating rings are "in-situ shrouded", making them practically indestructible. The coating offers excellent wear resistance in the low speed range (e.g. coast-down operation) in which contact between the seal faces is unavoidable.

The stationary, spring-mounted system is optionally available as a sub-cartridge in combination with a rotating seat made from ductile material. A secondary sealing function using O-rings allows it to be applied as a component seal.

Features

- Gas-lubricated
- Bi-directional
- Compact, radial design
- Ready-to-fit cartridge unit, also available as a component seal
- Single, double, tandem seal and tandem with intermediate labyrinth available

Advantages

- Wear-free and contact-free operation
- Self-cleaning 3D gas grooves
- High gas film stiffness
- Fits into small spaces (e.g. process gas screw compressors)

TDGS

The gas seal for single-stage steam turbines. A metal bellows allows it to work reliably even at high temperatures. The bearing oil is no longer contaminated by condensed steam, extending the bearing life and reducing maintenance costs accordingly.

Features

- Gas-lubricated
- Uni-directional or bi-directional
- Elastomer-free, no dynamic O-ring
- Ready-to-fit cartridge unit
- Single seal available

Advantages

- Wear-free and contact-free operation
- Self-cleaning 3D gas grooves

One outstanding feature of the EagleBurgmann gas grooves is its inclined bottom (picture: V-grooves, uni-directional). The lack of sharp baffle edges at the groove outlet allows dirt particles to be pulled through the sealing gap, reliably avoiding any clogging and guaranteeing safe operation. If deposits do build up in the sealing gap while the turbine is idle, they are expelled once the machine is restarted.

NF941

Seals from the NF941 series are used in screw compressors for special applications. They are hybrid seals that seal both aerostatically and aerodynamically. The separation gas is routed through holes in the stationary seal ring directly between the seal faces, while the lift-off is caused by specially designed gas grooves.

Features

- Single seal with double seal function
- Non-contacting from static to high speed condition

CSR

Lift-off type carbon ring seals feature very low gas consumption for both dynamic and static operation modes. In static operation the carbon segments will contact the shaft reducing gas consumption to a minimum. In dynamic operation, the profiled inner surface of the segmented ring will ensure an aerodynamic lift-off at circumferential speeds $> 10 \text{ m/s}$ (33 ft/s). The segmented carbon rings float on a very thin gas film of few μm .

Features

- Lift-off type separation seal
- Gas-lubricated
- Bi-directional
- Ready-to-fit cartridge unit

Advantages

- Very low leakage
- No increased leakage in static operation

Product variant

CSR version for dry nitrogen

The CSR separation seal is also available for operation with very dry nitrogen with a dew point of at least $-90 \text{ }^\circ\text{C}$ ($-130 \text{ }^\circ\text{F}$). Newly developed carbon ring materials ensure smooth operation even when the CSR is supplied with very pure nitrogen, from e.g. cryogenic production. The reliability of the system can be increased significantly as a result.

CobaSeal

Since it was launched on the market, this innovative sealing solution has proven its worth worldwide in both first fit and retrofit applications. It consists of a rotating seat made of ductile material and a stationary, spring-loaded seal face. The separation gas is routed through axial holes in the stationary seal ring into the middle of the sliding face. It is then divided in the sealing gap into two leakage flows which are routed to the inner and outer diameters of the seal face.

Features

- Gas-lubricated
- Bi-directional
- Ready-to-fit cartridge unit
- Self cleaning 3D gas grooves
- Aerostatic and aerodynamic lift-off

Advantages

- Extremely low leakage
- Double arranged (co-axial) dry gas seal with just one pair of seal faces
- Insensitive to oil contamination due to its special design
- Wear-free, non-contacting operation in all conditions
- Insensitive to radial vibrations due to axial sealing gap
- Slow-roll or turning operation capable (static lift-off)
- No limits regarding dew point of separation gas (silicon carbide instead of carbon)
- Lower N_2 consumption than any other system
- N_2 can be switched off during standstill - the gap will close and still provide the best oil sealing performance
- Best in class oil sealing by extremely small sealing gap and sling effect of rotating ring

Operating range (see note on page 1)

Shaft diameter: 29.5 ... 210 mm (1.16" ... 8.27")
 Design pressure (vent): $p = 0 \dots 15 \text{ bar}$ (0 ... 218 PSI)

Single DGS + CobraSeal = Tandem seal The CobraSeal is not just an excellent separation seal. It can also be used as a true back-up seal for greater safety. A DGS-CobraSeal tandem arrangement can be operated at sealing pressures up to 20 bar (290 PSI). It does not need an intermediate labyrinth with N ₂ supply and existing single seals can be simply retrofitted, thus benefitting from increased operational safety.	1, 9	Seal face, stationary

TotalSealCare Service

TotalSealCare service modules

The modular seal service offered through TotalSealCare is as individual as are the demands of our customers. The range of services spans complete maintenance of all installed seals, through to stock management, as well as engineering, training and electronic data documentation.

Our TotalSealCare services consist of individual modules from which we assemble individualized service packages.

You can benefit from our many years of experience and expertise in all areas of seal technology, and our major store of practical knowledge.

Consulting & engineering

After establishing and analyzing all of the seals in a system, we work out standardization concepts based on the as-is status. The results we are hoping for are to reduce the number of seal types, sizes and materials used, and to improve the key figures of the system. We advise you relating to codes of practice and statutory regulations, and indicate what actions need to be taken.

Maintenance

In the plant or in the service center, qualified fitters and technicians look after all the aspects of seal maintenance: installation, startup, servicing, conversion, overhaul and repair. We record and document functionally relevant data (fault causes, measures for repair, costs). This means it is possible to assess seal operating times and maintenance costs on a continuous basis, thereby defining measures for extending service intervals.

On-site service

Our on-site service includes the components of an overhaul service, conversions and service container. We deploy a service unit directly on your premises: equipped with the basic suite of seals or a stock of seals discussed with you in advance, and staffed by qualified personnel. On-site, our work includes producing the necessary gaskets, ensuring that the documentation is complete and advising our customers on selecting and installing seals. Our range of services is rounded off by complete conversions (e.g. acc. to TA-Luft).

Inventory management

Based on your individual requirements and the applicable quality regulations, we develop a concept for inventory management of complete seals and spare parts. Furthermore, we optimize stocking on site or in the EagleBurgmann service center. In this way, you can reduce your administration overhead and concentrate on your key operations.

Seminars & training

We offer an extensive range of continuing education programs in seal technology. For service and maintenance personnel, skilled staff and engineers from various branches of industry such as refining, chemicals, power generation, foodstuffs, paper and pharmaceuticals. Our range includes group seminars, individual training and seminars specifically tailored to your requirements. At our premises or at a location of your choice.

Technical analysis & support

A team of seal specialists is responsible for rectifying process malfunctions or "bad actors". The latest methods such as thermography or data logging are used for diagnosing positions that are critical for the operation of the system and for working out measures to rectify them. In our research and development centers, we perform realistic tests on test rigs or in original pumps. The objective is to extend the MTBF and to increase system serviceability by individual and constructive solutions.

Service agreements

We offer our customers specific agreements that can be combined from the six service modules. Whether for individual seal systems, critical process elements, specific system areas or an extensive seal service for complete plants: the modular structure of our service makes it possible to satisfy individual requirements. With our tried-and-tested monitoring instrument, SEPRO, we can also record all data relevant for the seals for documentation and evaluation purposes.
